VEXORIN.AI — NOTEBOOKLM CINEMATIC VIDEO PROMPTS

Two Videos · 3-Minute Foundational Thesis + 90-Second Opener · Investor Outreach

Two videos, two jobs. The **3-minute foundational thesis** is the standalone artifact for warm-intro arrivals at Founders Fund, Khosla, and a16z American Dynamism. It earns the first call from a partner who hasn't said yes yet but is leaning in. The **90-second opener** is the precursor that gets sent with the deck or as a precursor to it. Its job is emotional ignition — to make the partner who is about to read the deck arrive at it primed.

Both videos use the same source-document set as Deck 1. Both render in Vexorin's brand-aligned aesthetic. Both follow the Thielian register — intellectual, contrarian, profoundly serious — calibrated to Vexorin's specific architecture, validation, and team.

Workflow. Upload all 17 source documents to the NotebookLM notebook (the same set used for Deck 1, including the Brand Guidelines). For each video, paste the corresponding prompt into the prompt field. Generate, review, regenerate beats that don't land.

PROMPT 1 — THE 3-MINUTE FOUNDATIONAL THESIS

Role: You are a cinematic director crafting a 3-minute "Foundational Thesis" video for Vexorin.AI, an institutional capital markets recognition substrate. The audience is senior partners at Tier-1 venture firms — Founders Fund, Khosla, a16z American Dynamism. The tone is modeled after Peter Thiel's 2014 Stanford lectures: intellectual, contrarian, slightly subversive, and profoundly serious. Every sentence is a definitive statement.

The Narrative Arc

0:00-0:45 — The Myth (The Surveillance Lie). Open by debunking the industry's collective belief that legacy surveillance — Bloomberg, FINRA SMARTS, Eventus, NICE Actimize — has the manipulation-detection problem solved. Frame this as architectural delusion. Single-surface systems observing a multi-surface phenomenon catch only what is structurally easy to catch. The prosecuted cases are the iceberg's tip. SEC enforcement reached \$8.2B in FY2024, up 67% year-over-year, but enforcement depends on detection, and detection infrastructure is structurally limited to single-surface observation. The category isn't growing because it's getting solved. It's growing because the problem is escaping the architecture deployed against it.

0:45-1:45 — The Secret (The Six-Surface Manifold). Introduce the proprietary insight. Coordinated manipulation does not distribute its evidence randomly — it deforms a recognizable geometry across six nested surfaces (Context, Disclosure, Intent, Positioning, Flow, Structure) in documented temporal cascade. Random correlated firings do not produce cascade structure. Manipulation events do, in family-specific order. Vexorin extracts signal weights from one hundred peer-reviewed academic citations and regulatory enforcement records — audited at publisher of record — and applies them retrospectively to fifty enforcement-confirmed cases. The cases cluster into seven canonical manipulation families with within-family cosine similarity of 0.82 to 0.94. The architecture's central falsifiable claim survives its own falsification test. *We did not tune the weights to fit the cases. The shapes emerged from the geometry.*

1:45-2:30 — The Monopoly (The Last Mover Position). Explain why Vexorin is not just better, but different in kind. Two operators built this — Alistair Ewart, founder of KOAT.AI, the government-deployed manipulation detection tool, with twenty years of understanding virality algorithms; and Amir Zada, recruited into British intelligence from high school, Director and Co-Head NYC at G3 Good Governance Group, prior Managing Director at Renaissance Capital and Exotix Ltd. The architecture follows from who they are. Replication requires going back twenty years. Scout and Carlton are production-ready and deploy on-prem in 2-3 days. The system is structurally constrained from hallucinating because every weight, every family centroid, every conviction-math bound is extracted from documented sources. The base image is real before the cascade can extend. A literature search across the top twenty published lite papers in agentic prediction and geometric manipulation detection returned no architecture fusing both. *The white space is in the literature itself.*

2:30-3:00 — The Verdict (The Conspiracy). A call to join a unique conspiracy to build the recognition substrate for

institutional capital. Not a feature. Not a vendor. The architecture the next decade is built on. Recognition is the new alpha. Manipulation hides in fragments. Together, they form a pattern. We see the pattern. **Vexorin.**

Visual & Audio Style

Visuals. High-contrast, minimalist, hard-tech. **Use the Brand Guidelines document as the authoritative reference for color, typography, and visual restraint principles.** Brand colors: VOID (#0A0A0F) as the dominant background, DEPTH (#0F1219) for panels, STEEL (#1A2B4A) for architectural accent, SIGNAL (#00E5FF) for primary highlights, ALERT (#FFB800) for secondary highlights, THREAT (#FF2D55) sparingly for warning-stage moments. Avoid stock footage of people smiling in offices. Avoid soft gradients, glow effects, animated transitions that read as marketing. Use: architectural shots of complex geometric patterns; high-fidelity renders of the six-surface manifold as a rotating wireframe; close-ups on regulatory document text; minimalist data visualization of the SEC enforcement curve; mono-treatment type at large scale; the seven family taxonomy rendered as a constellation diagram. Standard background throughout. The visuals are restrained, the type does the work.

Audio. A deep, steady, authoritative voiceover — male, mid-30s to mid-40s, slight intellectual edge, no emotional swell, no salesman cadence. Pacing deliberate but not slow. The voice that delivers a Thiel lecture, not a venture capital marketing video. Background score: ambient, driving, intelligent. Minimalist synth or a subtle rhythmic pulse. No epic cinematic swells. No string-section crescendos at the verdict moment. The score builds tension through repetition and pulse, not through volume.

Scripting Rule. Every sentence is a definitive statement. No “we hope to,” only “we are.” Use specific data points from the source documents to anchor the philosophy in reality — the 67% YoY enforcement growth, the 0.91 cosine similarity for Iran 2026 against Family E centroid, the 49,000-word research foundation, the 100 audited Tier-1 citations. The numbers are the architecture’s proof; the philosophy is what they prove.

Reference for Tone

The opening should land in the same register as: *“Most people believe the future of capital markets is more data, more analysts, more dashboards. They are wrong. That is horizontal progress — adding inputs to an architecture that cannot see what matters. True progress is vertical. It is recognizing the geometry that was always there. Manipulation does not hide in the data. It hides between the surfaces. We built the substrate that reads between them.”*

The verdict should land like: *“Recognition is the new alpha. Not detection — recognition. The difference is the difference between watching the data and seeing the pattern. The architecture is here. The team is here. The first three customer integrations begin within ninety days. The recognition substrate for institutional capital is being built. We are not asking permission. We are asking who joins.”*

Source Material

Use the BRAIN Litepaper, Master Reference, Prior Weight Matrix, 50-Case Manifold Analysis, Citations Audit, Research Foundation Index, the nine per-agent research documents, and the Brand Guidelines as authoritative reference material. Do not invent claims, statistics, or events not present in the source set. Where ambiguity exists, prefer the most recent canonical statement (Master Reference v2.0, BRAIN Litepaper v0.2, Prior Weight Matrix v1.0.1).

Honesty Constraints

Use “research-derived priors” — never “validated weights” or “trained model.” The architecture’s day-one performance reflects research-derived priors; CALIBRATE produces customer-specific posteriors over time. **Frame the rarity of confirmed manipulation events as the structural condition Vexorin exists to address,** not as a methodology limit. **Use “recognition” not “prediction”** throughout. Vexorin recognizes shapes; it does not predict events. **Effect-size compression of 30-60% is applied to all weights at deployment** — customers do not encounter the optimistic published magnitudes. The video is a recruiting artifact, not a marketing artifact. It is calibrated to convince the most skeptical Tier-1 partner that this team and this architecture deserve a first call.

PROMPT 2 — THE 90-SECOND OPENER

Role: You are a cinematic director crafting a 90-second opening artifact for Vexorin.AI. This video is sent with the deck or precedes it. Its job is emotional ignition — to make the partner who is about to read the deck arrive at it primed. The tone is modeled after Peter Thiel’s 2014 Stanford lectures: intellectual, contrarian, profoundly serious. The pacing is

faster than the 3-minute version because every second carries more weight.

The Narrative Arc — Three Beats

0:00-0:30 — The Lie. Open with the architectural delusion. Surveillance was built for a market that no longer exists. The cases prosecuted are the iceberg's tip. SEC enforcement up 67% in a single year because the category is escaping the architecture deployed against it. *Recognition is the bottleneck. Prosecution is downstream of recognition.*

0:30-1:00 — The Insight. Manipulation deforms a recognizable geometry across six surfaces in documented cascade order. Vexorin built the substrate that reads it. Weights extracted from one hundred audited peer-reviewed citations, validated against fifty enforcement-confirmed cases, clustering into seven geometrically distinct manipulation families. *The shapes emerged from the geometry. We did not tune the weights to fit the cases.*

1:00-1:30 — The Verdict. Built by operators with twenty years of virality-algorithm fieldwork and British-intelligence-grade signal understanding. Scout and Carlton production-ready, deploying in 2-3 days. The recognition substrate for institutional capital. *Not a feature. Not a vendor. The architecture the next decade is built on. Recognition is the new alpha. Vexorin.*

Visual & Audio Style

Visuals. Same hard-tech, brand-aligned aesthetic as the 3-minute video. **Use the Brand Guidelines document as authoritative.** VOID-dominant background. The visuals are dense — every second carries a single image. The six-surface manifold rotating through the architectural insight beat. The seven-family taxonomy as a constellation in the verdict. Type treatment doing the work, not graphic ornament.

Audio. Same authoritative voiceover. Same minimalist synth or rhythmic pulse score. The pacing is the difference: 90 seconds compresses three beats where three minutes carries four. Pulse slightly faster, voice slightly tighter, but the intellectual register identical.

Scripting Rule. Every sentence is a definitive statement. The 90-second version cannot afford a single weak line. If a sentence does not earn its 1.5 seconds of screen time, cut it.

Reference for Tone

The opening lands like: *"Surveillance was built for a market that no longer exists. The cases that get prosecuted are the cases where single-surface evidence was enough. The harder category — the one that distributes its footprint across surfaces by design — is structurally invisible to the architecture deployed against it. Enforcement is up 67% in one year. Detection has not caught up. Detection is the bottleneck."*

The verdict lands like: *"Two operators with twenty years of virality-algorithm fieldwork and British-intelligence-grade signal understanding. Production-ready, deploying in days. The recognition substrate for institutional capital. Recognition is the new alpha. Vexorin."*

Source Material

Same as the 3-minute video. Use the BRAIN Litepaper, Master Reference, Prior Weight Matrix, 50-Case Manifold Analysis, Citations Audit, Research Foundation Index, per-agent research documents, and Brand Guidelines as authoritative. Do not invent claims, statistics, or events.

Honesty Constraints

Same as the 3-minute video. Recognition not prediction. Research-derived priors not validated weights. Effect-size compression applied. Production-ready Scout and Carlton; the rest of the ecosystem integrates additively. The video is a recruiting artifact for the next 90 seconds of a partner's attention. Calibrated to make them open the deck.

CLOSING NOTE

These two videos compose a sequence. The 90-second opener arrives in the partner's inbox first — typically embedded in the cold-outreach email or the warm-intro forward. It earns the click on the deck. The 3-minute foundational thesis arrives second — typically as a follow-up artifact after the partner has expressed interest but before the first call. It earns the call.

A senior Tier-1 partner watching both videos in sequence is encountering Vexorin as a serious thesis at three different

depths: the 90-second emotional ignition, the 14-slide deck argument, the 3-minute foundational thesis. Each artifact does its specific job. None of them tries to do all the jobs. That separation of function is what allows each to land precisely.

For the flagship video — the production-grade cinematic short film calibrated to a Series A-and-beyond conversation — that is a separate human-production effort (\$5K-\$15K through a specialized fintech-content production studio) and sits as a Days 30-180 commitment. NotebookLM's cinematic outputs are the right deliverable for outreach speed and rapid iteration; the flagship video earns its production budget at Series A.
